

Simple WebSocket Server

by [Shadow Grove Games](#)

Please follow these instructions to create a WebSocket server in Unity using the provided asset, enabling real-time data exchange with other tools:

Let's get started!

1. Add the Simple Events WebSocket Server Prefab to your scene.
2. Create an empty game object and attach a script to it.
3. Write a script that inherits from `WebSocketEndpointBehaviour`.

```
1 public class EchoEndpoint : WebSocketEndpointBehaviour
2 {
3     public override void OnConnect(WebSocketEventArgs arg)
4     {
5         Server.SendMessage("Hello!", arg.clientId);
6     }
7
8     public override void OnTextData(string text, WebSocketEventArgs arg)
9     {
10        Server.SendMessage($"Echo: {text}", arg.clientId);
11    }
12 }
```

4. Place your game object with the script into the Endpoint Handlers of the Simple Events WebSocket Server.
5. Specify the desired path for the endpoint under Endpoint Path, for example, "echo".
6. Connect to your endpoint using a WebSocket client or website/application, using the following address: `ws://127.0.0.1:13100/echo`.
